

WASHER

THANK YOU FOR SCHEDULING YOUR WASHER INSTALLATION!

PLEASE ENSURE THE FOLLOWING PRIOR TO DELIVERY:

Water shut-off is located within 4'-6' of appliance
Shut-off valve is in good condition and requires no plumbing alterations to connect a standard ¾"
threaded hose connection*
A dedicated circuit, appropriate electrical outlet is located within 3' of the Washer.
Drain is in good working condition, free of obstructions, and within 2'-4' of the Washer.
Stacking kit and/or pedestals are purchased (if applicable)
Space provided meets manufacturer's required minimum cabinet dimensions**

If any of this above information is unknown or incorrect, please reach out to your sales associate with ample time prior to delivery for assistance.

- * Installation <u>CANNOT</u> be completed without correct and functional water shut-off valve. It is recommended to test water valves prior to delivery if possible. Our installers will notify you if the valve is faulty. A licensed plumber must be contacted to fix faulty valve. <u>Water MUST be supplied to the home to flush the line and test all connections.</u> If water is not supplied to the home, responsibility falls on the homeowner to check and verify all connections or installation may not take place until water is supplied to the home. The delivery can still take place but there's no guarantee that the appliance will be installed. If rescheduling is needed due to site deficiency, it is not guaranteed to be immediate. An extra trip & labor charge may be applied for each added visit.
- ** Our installers <u>DO NOT</u> make any modifications to floors, cabinets, countertops, plumbing, or electrical. Specs for appliance MUST be met for full installation completion. Our installers are on a scheduled timed route and cannot wait for alterations to be made. If rescheduling is needed due to site deficiency, it is not guaranteed to be immediate. An extra trip & labor charge may be applied for each added visit.
